

FRATERNITI ONE

Phase 1 software requirements | Franchise login, KYC, payment verification and LOI e-sign

Implementation handoff for Apur • Version 1.0 • 25 September 2026

This is the first build, preceding the signed-LOI lifecycle in the earlier Fraterniti One specification. A single onboarding/store record must flow into the later project lifecycle without creating a duplicate.

1. Outcome and scope

- Sushant or an authorised Sales/Admin user creates a Google Workspace ID for the proposed store after receiving PAN and Aadhaar details through the approved intake process.
- An authorised Fraterniti One administrator provisions the franchise persona against that exact Workspace email; the franchisee gets one login ID and an initial password through a secure invitation/reset flow.
- The franchisee signs in, completes KYC, uploads proof of the initial payment, reviews the generated LOI and later completes Aadhaar e-sign when Accounts has accepted the payment.
- A designated company signatory signs after the franchisee; the fully signed LOI becomes available in the portal and the onboarding record enters LOI Complete.

2. Workflow and gates

Step / owner	Action	Exit condition
1 • Sales / Sushant	Receive PAN and Aadhaar card details; create store Google Workspace account and record its canonical email.	Workspace ID active and unique.
2 • Admin / Apur setup	Create provisional store onboarding record and franchise persona linked to the same email. Issue login invitation.	One active franchise user mapped to one store record.
3 • Franchisee	Set password; upload KYC and payment receipt; confirm application details.	Required files and fields submitted.
4 • Internal review	KYC reviewer validates identity/fields; Accounts independently accepts, rejects or requests clarification for receipt.	KYC accepted; payment accepted.
5 • System / authorised staff	Populate approved LOI template and publish locked draft for franchisee preview.	Correct version and commercial data confirmed.
6 • Franchisee	Initiate Aadhaar e-sign through authorised provider.	Provider reports verified completion.
7 • Company signatory	Review same version and sign.	Both signatures valid; final PDF archived.
8 • System	Mark LOI Complete and expose final download; later lifecycle can begin.	Audit trail and provider certificate saved.

Sequence rule: LOI may be generated and previewed while payment is under review, but franchisee e-sign stays disabled until Accounts accepts the payment and KYC is accepted. Company signing stays disabled until the franchisee signature succeeds. No local checkbox may substitute for provider confirmation.

3. Roles and permissions

Role	Allowed actions
Franchisee	Own store only: login, update draft application, upload/re-upload requested files, view receipt/KYC status, preview LOI, trigger e-sign when eligible, download final LOI.
Sales / Sushant	Capture intake, create/record Workspace ID, request internal provisioning; view onboarding progress. No payment approval or company signing.
System Admin	Create/disable account, map canonical Workspace email, assign roles/signatory, manage template version; no implicit payment acceptance.
KYC reviewer	Accept/reject/request resubmission with reason, view restricted identity documents.
Accounts	Review receipt against bank settlement/ledger, approve/reject/request clarification, capture verification reference; no self-approval by uploader.
LOI preparer	Generate/verify commercial values and release LOI preview; cannot edit a version already sent for signing.
Company signatory	View final version and e-sign only after franchisee signature.

4. Core data and forms

- Store onboarding: onboarding ID, brand/format, proposed location, legal applicant name, entity type, contact number, canonical Workspace email, Sales owner, current state, timestamps. Project ID may be reserved here and reused later.
- KYC: PAN number/name, Aadhaar holder name and masked last four digits, entity/company documents where applicable, authorised signatory proof if entity is company, file type, version, reviewer, review outcome and reason. Confirm legal applicant and signatory fields against approved LOI template.
- Payment: declared amount, payment date, mode, transaction/UTR reference, receipt file, bank/ledger verification reference, verified amount/date, Accounts actor, decision and reason. Upload is evidence, never proof of cleared funds.
- LOI: template ID/version, brand, store/location, parties, fee/amount, territory, commercial terms, immutable PDF hash, generated time, franchise signature state, company signature state, provider envelope/certificate ID and signed PDF.

5. State machine

Account: Invited → Active → Suspended. Onboarding: Awaiting KYC/Payment → Under Review → Corrections Requested or Ready for Signature → Franchise Signed → Company Signed / LOI Complete. Independent review statuses: Missing, Submitted, Changes Requested, Accepted. E-sign: Not Started, Sent, In Progress, Completed, Failed, Expired, Cancelled. A failed/expired envelope can be restarted with a new auditable attempt.

If KYC or payment is rejected, show the reason and reopen only the affected upload. If LOI terms change after e-sign initiation, void the old envelope and obtain both signatures on a newly versioned PDF. Never overwrite signed copies.

6. Functional requirements and acceptance checks

ID	Requirement / acceptance
P1-01	Provisioning enforces exact unique Workspace email, store link and role. Duplicate email/store invitation is blocked with a clear error.

ID	Requirement / acceptance
P1-02	Initial password is never displayed to internal staff or stored in plain text. One-time invitation/reset expires; lockout/rate limiting and password recovery work.
P1-03	Franchisee sees only its onboarding record and documents. Direct URL/API access to another store returns denial.
P1-04	KYC upload supports PDF/JPG/PNG, size/type validation, malware scan and version history. Sensitive Aadhaar data is masked outside authorised reviewer views.
P1-05	Payment receipt submission creates an Accounts review item. Only Accounts acceptance changes payment status; UTR duplicates and mismatches are flagged for review.
P1-06	LOI generated from approved template with mandatory fields validated; preview shows version, parties, amount and location. Release requires authorised staff action.
P1-07	Franchisee signing control remains disabled until KYC and payment accepted. Provider handles Aadhaar authentication and callbacks; final signing requires verified provider completion.
P1-08	Company signatory can sign only the same version after franchisee completion. Downloadable signed PDF and completion certificate appear only when both have completed.
P1-09	Audit log records invitation, login/reset, file version, review decision, LOI generation/release, e-sign callbacks and completion with actor/time/version.
P1-10	Statuses and next actions appear on franchise home and internal queues; failed e-sign callbacks are retryable and visible to Admin.

7. Security, integrations and operational notes

- Use email as the account identifier. Whether to enable Google SSO later is a separate decision; the requested first release uses an ID/password invitation. Confirm whether franchisees actually control the newly created Workspace mailbox before issuing invitations.
- Do not email a shared static password or Aadhaar copy. Use encrypted storage, least-privilege access, signed document downloads, retention policy and audit logging. Collect only identity data the process needs; never store Aadhaar OTP/biometric data.
- Use an authorised Aadhaar e-sign provider (for example an approved Leegality integration if contracted). Provider account, legal document format, API/webhook behavior, sandbox and Aadhaar flow must be confirmed before integration.
- Webhook processing must be idempotent; verify signature, envelope ID and PDF hash; tolerate duplicate or delayed callbacks. Support manual reconciliation without silently marking a signature complete.
- Set configurable notification templates for invitation, correction request, payment accepted/rejected, signing ready, franchise signed, company signed and completed LOI.

8. Delivery boundaries and decisions for Apur

In scope: admin provisioning, franchise login/reset, onboarding record, KYC/receipt uploads, separate review queues, LOI generation/preview/versioning, two-stage Aadhaar e-sign, final archive and audit trail. Later project execution, construction, HR, procurement, royalties and broad franchise dashboards remain subsequent phases.

- Confirm official product spelling and domain, the approved LOI template and variable fields, signatory authority, commercial approval owner, and required KYC list for individual vs company applicants.
- Confirm Workspace creation method (manual by Sushant versus Google Admin API), mailbox ownership and invitation delivery channel.

- Confirm e-sign vendor, provider pricing/contract and whether both franchisee and company representative use Aadhaar e-sign or the company signs with another legally approved provider mode.
- Confirm Accounts reconciliation source and whether partial payments can qualify; default gate requires the full LOI amount accepted.
- Confirm production retention/access policy with counsel and privacy owner before uploading Aadhaar documents.

Definition of done: one test store completes the entire flow with real role separation, a rejected receipt is resubmitted, a changed LOI creates a new signing version, the final PDF/certificate and audit events are downloadable, and another franchisee cannot access that store. Provider sandbox success alone is not production sign-off.

9. Screen design appendix

Functional desktop wireframes below define controls, content, gates and role-specific views. Names and data are illustrative. Apur should implement responsive mobile layouts for the same actions.
